Abstract Based on the data from the International Agricultural Biotechnology Application Service Organization (ISAAA), the herbicide tolerance transgene events of 4 crops, including cotton (*Gossypium hirsutum*), soybean (*Glycine max*), canola (*Brassica napus*) and maize (*Zea mays*) were summarized. The aim is to provide important references for the development of herbicide tolerance transgenic crops in China. It was found that there were 328 herbicide tolerance transgene events by the end of 21 May 2017. These events are approved by the country concerned for direct consumption or as an additive or for cultivation. Herbicide tolerance transgene events of cotton, soybean, canola and maize were 39, 28, 32 and 201, respectively, accounted for 11.89%, 8.53%, 9.76% and 61.28% of the global herbicide tolerance transgenic events, respectively. Nineteen herbicide tolerance genes, which are derived from 16 kinds of organisms, involved in these herbicide tolerance events of these four crops. Seven out of 19 herbicide tolerance genes are derived

from five plant genomes, including maize, arabidopsis (*Arabidopsis thaliana*), soybeans, tobacco (*Nicotiana tabacum* cv. Xanthi) and oats (*Avena sativa*), and the rest of 13 from microbial genomes. These 19 genes displayed tolerance to nine kinds of herbicides, which are glyphosate, glufosinate, imidazolinones, 2,4-dichlorophenoxy (2,4-D), isoxazolone, dicamba, sulfonylureas, mesotrione and bromoxynil. Singular herbicide tolerance events, multi herbicide tolerance events, stacked gene events (herbicide tolerance and other trait, such as insect resistance) were 25, 18 and 257, respectively, which accounted for 8.3%, 6% and 85.7% of the total herbicide tolerance events of four crops. These events were developed by eight companies, namely Syngenta, Monsanto Company, DuPont, Bayer CropScience, Dow AgroSciences LLC, BASF, Genective S.A. and the Stein Seed Farm Inc.(USA). Compared to the above international situation, the most of the herbicide tolerance events are glyphosate tolerance, mainly from microorganisms in China. Therefore several suggestions are put forward for developing herbicide tolerance events scientifically in China. Firstly, it is suggested to focus on the development of herbicide tolerance transgene events which should be from plants, because plants have abundant herbicide tolerance genes and herbicide metabolic genes. Secondly, it is recommended to develop glufosinate tolerance transgene events due to characteristics of glufosinate, such as broad spectrum, low toxicity and high activity, environmental compatibility, and excellent weed control effects. Thirdly, other herbicides tolerance transgene events, such as 2,4-D, mesotrione, bromoxynil and isoxazolones should be developed. The single herbicide tolerance crop would lead to the evolution of herbicide resistance weeds due to overreliance on a single herbicide or group of herbicides that share the same mechanism of action or of metabolism. Transgenic crops carried double herbicide tolerance and even more herbicide tolerance genes allow to rotations of herbicides with different modes of action and different metabolic pathways, which are more likely to delay the evolution of herbicide resistant weeds than using herbicide of the same mode of action. Finally, it is suggested to cultivate the event with stacked traits, which could improve the economic value and ecological benefit of the transgenic crops.

抗除草剂转基因作物是利用转基因生物技术,将具有抗除草剂性状的基因通过根瘤农杆菌(*Agrobacterium tumefaciens*)介导、基因枪等方法转入到作物的基因序列中,使作物能表达对特定除草剂的抗性(向文胜等,1998)。随着转基因工程的快速发展以及抗除草剂基因的获得,抗除草剂转基因作物的转化事件数量明显增加。根据国际农业生物技术应用服务组织(International Agricultural Biotechnology Application Service Organization, ISAAA)提供的数据(<http://www.isaaa.org/gmapprovaldatabase/default.asp>,通过高级查询所需的作物及作物转基因特性获得数据),截止2017年5月21日,共有328个抗除草剂转化事件(这些抗除草剂转化事件均被相关国家授权直接食用或作为添加剂或用于栽培),其中棉花(*Gossypium hirsutum*)、大豆(*Glycine max*)、油菜(*Brassica napus*)和玉米(*Zea mays*)的抗除草剂转化事件300个,占抗除草剂转化事件总数的91.46%。本文

4 我国抗除草剂转基因作物发展现状及建议

4.1 我国抗除草剂转基因作物的发展现状

目前国内研发的抗除草剂转基因作物主要是单一抗草甘膦性状，其次是抗草铵膦性状；另外还有抗咪唑啉酮类、磺酰脲类和溴苯腈的性状。

我国科研工作者已经获得一批稳定表达的单抗除草剂和具有抗虫抗除草剂复合性状的转基因棉花新材料。中山大学生物防治国家重点实验室及河南师范大学生命科学学院等单位将抗草甘膦突变基因 5- 烯醇丙酮酸莽草酸-3- 磷酸合成酶 M12(5-enolpyruvylshikimate-3-phosphate synthetase M12, *aroAM12*) 导入到棉花中，获得了抗草甘膦的再生植株，并通过 Southern 及 Western 试验验证了该基因的导入，转化株对草甘膦具有很高的抗性（谢龙旭等，2004）。刘锡娟等（2007）通过花粉管通道法转化棉花，获得了 3 株具有草甘膦抗性的转基因植株。冯艳（2009）以百棉 1 号为受体，通过农杆菌侵染棉花茎尖，获得了抗草铵膦转基因棉花植株。中国农

业科学院棉花研究所构建了含有从高抗草甘膦的棉花突变株中克隆的 *epsps* 基因的植物表达载体，为进一步在棉花中转化奠定了基础（孙豹，2014）。王霞等（2014）通过农杆菌介导法成功将 G10-5- 烯醇丙酮酸莽草酸-3- 磷酸合成酶（G10-5-enolpyruvylshikimate-3-phosphate synthetase）基因（*G10aroA*）转入棉花。中国农业科学院生物技术研究所郭三堆研究团队获得了转基因抗草甘膦抗虫棉花材料，并已经进入环境释放阶段（郭三堆等，2015）。

中国农科院作物研究所研发的来自于可变盐单胞菌（*Halomonas variabilis*）的 G2-5- 烯醇丙酮酸莽草酸-3- 磷酸合成酶（G2-5-enolpyruvylshikimate-3-phosphate synthetase）的基因（*G2-aroA*）、甘氨酸-N 酰基转移酶（glycine-N-acetyltransferase）基因（*gat*）已经转入大豆中（邱丽娟等，2017）。中国农科院作物研究所成功将抗草甘膦基因 *aroA* 和 N-乙酰转移酶 *gat* 基因转入大豆中（荣非等，2015）。中国农科院生物技术研究所于 2015 年申请了一种抗草甘膦转基因大豆及其制备方法和应用的专利，所转基因也是拥有自主知识产权的 *aroA* 基因以及草甘膦 N-乙酰转移酶 *gat* 基因（邱丽娟等，2015）。韩强（2015）利用农杆菌介导的大豆子叶节遗传转化方法，获得了携带草甘膦抗性基因 *g10-epsps* 和抗虫 *Bt* 基因的大豆转化植株。

中国科学院微生物研究所将抗溴苯腈基因 *bxn* 导入油菜，获得了抗溴苯腈转基因油菜（钟蓉等，1997）。江苏省农业科学院筛选到了自然突变的抗咪唑啉酮类除草剂的甘蓝型油菜，把突变基因的核酸序列，命名为 *BnALS1R* 基因，应用杂交、回交植物常规育种方法将该基因导入其他油菜品种或品系，提高了目标品种或品系对抗咪唑啉酮类除草剂的耐受性。还以甘蓝型油菜抗磺酰脲类除草剂突变体为材料，获得突变体中的抗性基因，命名为 *BnALS3R* 基因，利用构建的植物表达载体将该基因导入无抗性的植物中，可提高转基因植物对磺酰脲类除草剂的抗性（浦惠明等，2010；胡茂龙等，2013）。沈志成和高建华（2011）从耐辐射奇球菌（*Deinococcus radiodurans R1*）中分离出的 Dein R1 EPSP 合酶基因 *G7*，并将经过人工改造得到的基因 *G10* 导入油菜，获得对草甘膦的抗性。

中国农业大学对 *cp4 epsps* 的密码子及编码框进行了改造，同时在优化后的 *epsps* 基因 5' 端增加了一个来源于高粱的叶绿体转运肽，整合了叶绿体信

号肽并经过密码子优化的基因命名为 *CC-MEP-SPS*, 把该基因转入玉米中, 获得了有自主知识产权的转基因抗草甘膦玉米 CC-2(赖锦盛等, 2012)。北大北农科技股份有限公司研发的抗草甘膦和草铵膦的双抗转基因玉米 DBN9877, 抗草甘膦基因 5-烯醇丙酮酸莽草酸-3-磷酸合酶基因(*epsps*)可以是从土壤农杆菌菌株中分离得到的, 且可以通过优化密码子或者以其他方式改变编码; 抗草铵膦基因是膦丝菌素 N-乙酰基转移酶基因(*pat*)(康越景等, 2015)。孙越等(2015)通过农杆菌介导的玉米茎尖遗传转化法将 5-烯醇式丙酮酸莽草酸-3-磷酸合酶基因(5-enolpyruvyl-shikimate-3-phosphate synthase, *epsps*)和杀虫蛋白基因(*Bt*)*cry1AcM* 转入了玉米, 并通过分子检测、草甘膦抗性筛选和田间接种亚洲玉米螟(*Ostrinia furnacalis* (Guenée))试验筛选出了遗传稳定且抗亚洲玉米螟、抗除草剂草甘膦的转基因玉米株系。北京市农林科学院将玉米核酮糖二磷酸羧化酶小链基因(ribulose bisphosphate carboxylase small chain, *RBCS*)叶绿体引导肽与 GenBank: GM718572.1 的 *epsps* 基因融合, 获得了融合序列的优化基因 *G23V-epsps*, 将该基因转入玉米中获得了具有高抗草甘膦特性的玉米品种(姜志军等, 2016)。

4.2 我国抗除草剂转基因作物的研发策略

4.2.1 着重开发来源于植物的抗除草剂基因的转化事件

目前, 全球抗除草剂转基因棉花、大豆、油菜和玉米独立转化事件中所涉及的抗除草剂基因有 19 种, 基因来源于 16 种生物, 对 9 种(类)除草剂有抗性。其中微生物来源有 11 种, 涉及的抗除草剂基因有 12 种; 植物来源有 5 种, 涉及的抗除草剂基因有 8 种。在我国, 抗除草剂转基因作物的性状主要是抗草甘膦, 且主要来源于微生物。与微生物来源的抗草甘膦基因相比, 植物中有丰富的除草剂抗性基因和除草剂代谢基因资源, 因此建议着重开发来源于植物的抗除草剂基因转化事件。

4.2.2 加强培育转抗草铵膦基因及其他除草剂基因的转化事件

目前国际上抗草铵膦的棉花、大豆、油菜和玉米转化事件分别为 18、13、21 和 169 个, 占该类作物抗除草剂转化事件的 46.15%、46.42%、65.62% 和 84.08%。在我国, 尚未见报道有自主知识产权的抗

草铵膦基因的转化事件, 因此应加强抗草铵膦转化事件的培育, 这是由于草铵膦具有杀草谱广、低毒、活性高、在土壤中易降解、对作物安全、漂移小、用量少、环境相容性好和杀草迅速等特点。另外应加大培育抗其他除草剂的基因事件, 如抗 2,4-D、硝磺草酮、溴苯腈以及异噁唑草酮的转化事件。

4.2.3 加强培育多抗除草剂及复合性状的转化事件

随着转基因技术的发展, 多抗及复合性状的转基因作物的研发日益受到人们的重视, 通过 ISAAA 的数据可以看出, 目前国际上多抗除草剂转化事件在棉花、大豆、油菜和玉米中分别为 3、9、1 和 4 个, 占该类作物总抗除草剂转化事件的 7.69%、32.14%、3.12% 和 2%; 复合性状的转化事件分别为 26、9、21 和 186 个, 占该类作物总抗除草剂转化事件的 66.67%、32.14%、65.62% 和 92.54%。单一抗除草剂的作物在长期使用目标除草剂后, 田间杂草产生抗药性的可能性将大大增加, 那么该抗除草剂作物也将失去应用的价值。与抗单一除草剂的转基因作物相比, 具有双抗甚至多抗除草剂的转基因作物可以轮换除草剂的使用, 避免抗性杂草产生, 因此建议培育抗两种以上除草剂的转化事件, 另外还建议培育抗除草剂和抗虫的复合性状的转化事件, 提高转基因作物的经济价值和生态效益。
